Goulburn Regional Art Gallery

13 October-10 November *Echoes of Home*: Memory and mobility in recent Austral-Asian art Curated by Christine Clark for the Museum of Brisbane, this travelling exhibition presents recent works by 14 Asian artists who have made their home in Australia. Drawing on the artists' own stories and experiences, the exhibition represents a diverse range of art media including textiles, ceramics, fashion, jewellery, paper, sculpture and painting. The artists include Keiko Amenomori-Schmeisser, Dadang Christanto, Jaishiree Srinivasan and Savanhdary Vongpoothorn. The exhibition is supported by the Commonwealth Government through the Australia Council and Visions of Australia.

15-24 November Goulburn Region HSC Body of Work Working with regional secondary school art teachers, the Gallery presents a selection of bodies of artworks made by regional students for the 2007 HSC. The exhibition addresses the meaning of a body of work and what is required of it.

29 November-13 December *Owning our School* Mulwaree High School's Owning our School sculpture project has students making sculptures to enrich their school environment. This exhibition showcases their work and, through a silent auction, raises funds to continue the project.

In Your Garden

From Irene Turner

Vegetables to plant now

Seeds of beans-climbing and dwarf, carrots, beetroot, radishes, parsnips.

Seedlings or seeds - cabbages, silver beet, herbs, cucumber, squash, zucchini, pumpkin, capsicum, sweet corn, celery, Tomatoes – but cover if we get a frost.

Flowers

Seed or seedlings ageratum, carnations, cosmos, dahlia dwarf, linaria, lobelia, marigold, nasturtium, petunias, phlox, snapdragons, and portulaca, Amaranthus, celosia, cockscomb, coleus. gazanias and zinnia.

Roses – check for aphids and black spot. You can spray with rose spray or just squash the aphids with your fingers, or hose off.

Cherry Trees – fruiting and ornamental, can be attacked by cherry slug. If small in numbers don't worry. You can spray with lime made into a liquid form, about 1 cup of lime to a bucket of water. Also if branches are low, cover with baby powder or dust with lime.

Plant of the Month Kalmia (Calico Bush)

Native to the American mountains, the Kalmias are a small genus of evergreen shrubs that enjoy exactly the same conditions as their Rhododendron relatives; part shade, humidity, an acid soil rich in leaf mould and plenty of water. The laurel-like leaves are dark and glossy. The flowers are white, red or appleblossom pink. They have a curious sticky feel and are borne profusely at the ends of last season's growth during spring.

Kalmias are hardy and will survive temperatures well below -18°C. They need frosty winters to do well. They develop into a broad, densely foliaged shrub, 2-3 metres and about as wide, slow growing.

Plant out in late spring or early autumn and don't prune except to remove faded flowers. They are best propagated by layering new wood in late summer, but may also be struck from cuttings, though this is far less reliable.

Glycerine & Rosewater Cleansing Cream (for dry & normal skins)

Waxes are melted in one container while oils are warmed in another. All ingredients should be about the same temperature when you mix them together or the mixture may curdle. You can substitute any suitable herbal infusion for the rosewater.

4 tblsp (60ml) lanolin 3 tblsp (45ml) rosewater 50ml almond oil 1 tsp (5ml) zinc oxide ointment 1 tblsp (15ml) glycerine 6 drops essential oil of rose 1/8 tsp (0.65ml) borax

- 1. Melt the lanolin and gently heat the almond oil and glycerine together.
- 2. Slowly pour the oil and glycerine mixture into the lanolin, beating constantly.
- 3. Dissolve the borax in the warmed rosewater and add gradually to the lanolin and oil mixture, beating all the time.
- 4. Leave to cool.
- 5. When cool and creamy, beat in the zinc oxide and rose oil.
- 6. Spoon into prepared jars and label.

Southern Tablelands Farm Forestry Network

WEED CONTROL AND FERTILISING FOR FARM FORESTRY

Weed control is probably the most important technique to get right when establishing either pines or natives. The importance of weed control cannot be emphasised enough. This is because weeds compete with the young trees for both moisture and nutrient, and as weeds are often more shallow rooted than trees, they get moisture and nutrient before the trees. Most commonly, weed control is done through the application of herbicides, as this is the quickest and most efficient method. However, weed control can be carried out by mechanical methods, and the use of mulches.

Weed control can be carried either pre or post planting, or a combination of both. Pre plant weed control is best with a broad spectrum knockdown herbicide, such as Glyphosate (Roundup), which may be combined with a residual herbicide for a longer lasting suppression of weeds. The best residual for native species is Simazine, while the best residual for pines in Hexazinone (Velpar). Pre plant weed control is best carried out with a spray unit spraying over the entire rip/mound line. The best time for a pre plant herbicide application is early to mid autumn, when there is still some soil warmth and weeds are still actively growing.

Post plant weed control is more difficult, but if there are weeds competing with the young trees, it is still essential. A herbicide that does not harm the young trees is required, such as Simazine for natives, and Hexazinone for pines. Glyphosate can still be used, but care must be taken to shield young trees from any of the herbicide getting on the foliage by shielding the tree. Post plant herbicide application can be carried out as a spot application around each tree, which lowers the herbicide cost.

There are also some granular herbicides on the market which are easy to apply with an applicator, such as a "Weed-a-metre". These granular herbicides include products such as Forestmix for pine, and Eucmix for most native species. All post herbicide application must be carried out four weeks after planting, but before the soil temperature gets too high, as damage can result otherwise. This is not a problem with pines, as they are planted over winter, but can be a problem with natives which are usually planted later. It is for this reason that a pre plant herbicide application is preferable with natives.

Whenever applying herbicide for weed control, it is critical that the directions on the label be followed to ensure a good result. Other methods of weed control can include mechanical removal of weeds (back breaking and soul destroying), and the use of mulches around young trees to prevent emergence of weeds. Neither of these methods is time or cost effective with a larger plantation.

And remember, the first three steps to successful tree establishment are weed control weed control and weed control!!!!

Once the weeds are under control, then newly planted trees should receive an adequate dose of fertiliser. The young seedling needs to be actively growing to best utilise the fertiliser, and the best time to apply fertiliser is early spring. If applied to early, much of the fertiliser will be lost through leaching past the roots before they can take it up.

Both native and pine trees commonly require nitrogen and phosphorus for rot and shoot development. However, some natives, such as Acacias and Casuarinas are leguminous. That is, they are nitrogen fixers (able to utilise atmospheric nitrogen), hence they will only require an application of phosphorus. Most rural supply stores will be able to provide a propriety mix containing nitrogen and phosphorus, and products such as Starter DAP and Starter FOS are good for use on young trees. For the nitrogen fixing natives, an application of superphosphate is all that is required.

Care must be taken in the application of fertiliser, as it can burn young trees. A dose of 150 grams per tree, placed in two semi circles either side of the tree at a distance of 15 to 20 cms from the stem gives the best result. If the trees are on a slope, then the fertiliser should not be above and below the tree, but level with the tree on either side. This is to prevent the fertiliser being either washed into the tree stem, or away from the stem.

The best way to apply the fertiliser is with a cup and bucket. Weigh the cup, then add 75 grams of fertiliser (one semi circle, or half the 150 grams per tree), and mark on the cup where the 75 gram mark is. Then it is a matter of placing two 75 gram semi circles around each tree from a bucket full of fertiliser. It is also best to wear gloves, as fertilisers can string cuts and abrasions on hands.

There are also some trace element fertilisers for young trees. In the Southern Tablelands, the most essential trace element is Boron, which should be applied in the second year after planting. About 40 grams per tree is required, and there are suitable commercial products such as Agribor available on the market. Again, timing is critical, because if Boron is applied when there is green grass close to

GOD'S REMNANT ASSEMBLY AUSTRALIA (GRA Australia)

Would you like to know more about Jesus?

Do you want to know the LIFE He has for you -

your destiny, your gifts, your purpose?

We are a husband and wife team with GRA, a trans-denominational missionary movement. GRA works around the world, including Iraq, Iran, Afghanistan, Nigeria, Sudan and is new to Australia. We believe Australia needs the Word, fresh and new, as it is being shared around the world and setting lives alight with the beauty and Truth of Jesus.

We have started a home Church in our community and introduce ourselves – Bunja and Judith Smith. If these words have stirred or touched you please contact us to hear more about this Ministry that is new to Australia:

by phone - **0401 912 193 or** by post -

Pastors Bunja and Judith Smith

Gods Remnant Assembly Australia

GPO Box 1695

Canberra City ACT 2601

Be part of this exciting work in our community:

Sunday morning - we sing and study His profound truths

Tuesday evening - we plan the ministry, outreach and study His Word

Thursday evening - we praise and enjoy a power prayer hour.

Jesus' love never fails. John 15:12

Although both our Churches are nominally Anglican, worshippers of all denominations are welcome at all services.

STFFN - Continued from previous page

the plant, then the grass will take up the Boron. Late summer is the best application time for Boron.

So if the site preparation is good, the planting has been properly carried out, and then if the weed control and fertilising is done properly, sit back and watch your trees grow.

Finally, the Southern Tablelands Farm Forestry Network is available to help with advice on all aspects of farm forestry. Have a look at our website, www.stffn.org.au, or become a member (membership is free).
